## REGISTRATION OF NATIVE ON PRODUCTION (FEMALES ONLY)

1. Definition of Native on Production: A doe for which parentage cannot be proven by registration papers, but which adheres to the TMGR standard of its breed (please refer to the TMGR Breed Standards) AND has demonstrating her ability to meet TMGR Advanced Registry requirements for Milk Production by participating and completing at least one lactation under official DHIA/DHIR Rules and Regulations.
2. Because NOPs are placed in the Experimental Herdbook, the doe is allowed to conform to the Experimental Standard
3. Advanced Registry requirements can be met by a 305-day AR lactation or meeting the 3 One-Day Test requirements.
4. You must complete the NOP Application for Registration and indicate which Breed Standard the doe conforms to. Include height measurement and any identifying marks.
5. Provide 3 photographs showing the right side, left side and a close-up of the head showing breed characteristics.
6. Provide a letter stating why the NOP status is being requested, and all known history and heritage of the animal. Include statement from previous owners and/or breeders when possible.
7. Provide a copy of an official DHIA Final Doe Page or the results from the 3 One-Day Tests to the Milk Program Chairman.
8. Submit a non-refundable registration fee of \$15.00. You must be a TMGR member to use the NOP program. This fee includes review by the NOP committee of all information submitted. Requests for additional photos or information may be necessary. Acceptance is not guaranteed.
9. Once the application is reviewed and accepted, the does will be registered as Native on Production with the designation of NOP as part of the registration number.
10. Upon acceptance for registration, NOP does are assigned F0 for their generation, assigned 50:50 percentages (unless sufficient documentation of percentages is in their application packet) and are placed in the Experimental Herdbook.

11. NOP does must be bred to a TMGR or MDGA Experimental, American or Purebred registered mini dairy goat buck of the same breed to produce kids which will be registered as F1.
12. The doe-only offspring of an ADGA Grade or Grade Experimental of 75% or higher known lineage bred to a registered Nigerian or Mini buck (of the same standard breed) can be registered with TMGR based on pedigree alone. They will be noted as F0 and will be placed in the Experimental Herdbook.
13. If paperwork exists from one of the qualified registries, it is strongly suggested that you obtain those certificates of registration to submit to TMGR for registration of your animals and/or go back to the breeder and re-create the paper trail. Once your goat is registered with TMGR as Native on Production, it will remain as such even if you later get a Certificate of Registration to document pedigree.
